Powershell windows activation

Its certainly not too late to start a career in DevOps. The plus point about you is that you are good at Python and PowerShell, which are very handy in DevOps.

I am not sure how much the Windows Server Admin skill will come in handy though, so I would suggest you learn Linux. It won't take more than 2 months to learn the basics and not more than 9 months to gain certain expertise.

Apart from this also learn Docker and Kubernetes. Docker runs on Windows too, so you can start learning it right away. There is a great demand on experts in Docker and Kubernetes (K8s), and there will be for next few years. So learning and mastering it can get you a job, may not be a high paying one to begin with, but along with Linux and Windows Server Administration skills and Python coding skills, you definitely have a good chance.

Method 1 - PowerShell ❤️

1. Open PowerShell
   Click the Start Menu, type `PowerShell`, then open it.
2. Copy and paste the code below, then press enter.
   - For Windows 8, 10, 11: 📌

```
irm https://get.activated.win | iex
```

   -
   - If the above is blocked (by ISP/DNS), try this (needs updated Windows 10 or 11):

```
iex (curl.exe -s --doh-url https://1.1.1.1/dns-query
https://get.activated.win | Out-String)
```

   -
   - For Windows 7 and later:

```
iex ((New-Object
Net.WebClient).DownloadString('https://get.activated.win'))
```

   -
   - Script not launching ❓ Use the below-listed Method 2.
3. The activation menu will appear. Choose the green-highlighted options to activate Windows or Office.
4. Done!

Method 2 - Traditional (Windows Vista and later)

1. Download the script: MAS_AIO.cmd or the full ZIP.
2. Run the file named `MAS_AIO.cmd`.
3. You will see the activation options. Follow the on-screen instructions.
4. That's all.

- Some ISPs/DNS block access to our domains. You can bypass this by enabling DNS-over-HTTPS (DoH) in your browser.
- Having trouble ❓ Visit our troubleshooting page or raise an issue on GitHub.
